

## ***AeroKits... Savannah Kit Suppliers and Service.***

Savannah Tip No 16:

I have noticed on several occasions that some Savannah owners, when using filler or Drip Seal to fair off the gaps when fitting the plastic tips to the flying surfaces, are inadvertently closing off the drain openings at the ends of these flying surfaces. These small gaps are necessary to allow the wings or flaperons etc to drain in the event of the aircraft sitting in rain or when washing.

You must ensure that all parts of the aircraft can drain properly or you could develop a very dangerous situation where some part of the airframe could contain large amounts of water which may result in an unexpected loss of control. Please refer to the photos for some examples.
