Savannah Tip No 13: *Have you noticed that the Fuel Pressure Gauge in some Savannah's reads less with increase in altitude?*

ie. the pressure may be 4psi at sea level but 2psi at 4500ft. this problem is easily fixed by drilling a vent hole in the rubber plug in the top of the case of the gauge. This issue was addressed a couple of years ago, but it is likely that there may still be a few owners who are not aware of the fix.
